- WAC 246-272B-06800 Recirculating gravel filters. (1) A recirculating gravel filter may be used to meet Treatment Level C.
- (2) Pressure distribution of the effluent to the filter media is required.
 - (3) Filter media must meet the following specifications:
 - (a) Effective particle size between three mm and five mm; and
 - (b) Uniformity coefficient less than or equal to two.
 - (4) Filter media depth must be at least thirty-six inches.
 - (5) The recirculating pump must be controlled by a timer.
- (6) The dosing schedule must provide for at least forty-eight doses per day, equally spaced throughout the day.
 - (7) Doses must be uniform in volume.
- (8) The influent or filtrate mixture must cycle through the fil-
- ter five times before dispersal.

 (9) The maximum hydraulic loading rate for the gravel filter is five gallons per day per square foot, if influent BOD_5 is no greater than 230 mg/L.
- (10) The hydraulic loading rate must be calculated on the basis of the incoming BOD as follows:

Loading Rate (expressed as gpd/
$$ft^2$$
) =
$$\frac{1150}{BOD_5 \text{ of septic tank}}$$
effluent

- (11) The maximum influent values are:
- (a) BOD_5 575 mg/L; and
- (b) 0&G 30 mg/L.
- (12) The minimum horizontal setback from the recirculating gravel filter must meet the sewage tank requirements in Table 3 in WAC 246-272B-06050.
 - (13) The filter bed must be contained in:
- (a) A flexible membrane-lined pit where the membrane has a minimum thickness of thirty mm and there is a three-inch layer of sand beneath the membrane; or
- (b) A concrete vessel that is water tight, durable, and structurally sound.
- (14) Monitoring ports for recirculating gravel filters must meet the requirements in WAC 246-272B-06400 (3)(b).
- (15) Two monitoring ports must be installed every one thousand square feet in the recirculating gravel filter and distributed uniformly throughout the filter area.
- (a) One monitoring port must be installed to the top of the media interface; and
- (b) One monitoring port must be installed to the bottom of the underdrain.
 - (16) The minimum volume of a recirculating mixing tank is:
- (a) One hundred fifty percent of the daily design flow for residential applications; or
- (b) One hundred percent of the daily design flow for nonresidential applications.
- (17) Underdrain and filtrate handling must be designed as required in WAC 246-272B-06750 (11), (12), and (13).
- (18) The return flow from the recirculating gravel filter must be split to direct:
- (a) A minimum of eighty percent of the effluent back to the recirculating or mixing tank; and
- (b) The remainder to the drainfield or next downstream LOSS component.
